Ankle rehabilitation stage 1

Information for patients

Physiotherapy Department

It is now important to start to get your foot and ankle moving normally.

- If you have just had your plaster removed and **you are allowed to get any wounds you have wet**, soak your ankle in warm water for 5 to 10 mins to remove any dry skin.
- You should be regularly moisturising any dry skin, **and if advised**, your scar site.
- Try to keep your foot raised (elevated) on a pillow or cushion with toes higher than your hip, when resting.

Exercises

At first your ankle will feel stiff and possibly painful. This is because it has been held in one position. By exercising regularly the feeling of stiffness and pain will gradually ease. The following exercises need to be done regularly; 3-4 times per day.

Please follow your physiotherapist's guidance on the number of repetitions for each exercise.

Moving ankle up and down (dorsiflexion and plantarflexion)

Pull your foot upwards as far as you are able, hold for 5 seconds, and then point your foot away from you as far as you are able, hold for 5 seconds.

Turning ankle inwards and outwards (inversion and eversion)

Turn the sole of your foot inwards and then outwards (keeping your knee still).

Assisted exercises

Use a towel or something which does not stretch to assist with the previous two exercises – pulling the foot upwards, inwards and outwards.

Hold for 5 seconds.

Ankle slides

Sit on a chair with your feet flat on the floor. Slide your injured foot backwards along the floor, keeping your foot flat on the floor throughout.

Toe scrunching

Sit on a chair and place a towel on the floor. Put your injured foot on the towel and using your toes 'bunch' the towel up and pull it towards you.

Seated heel raises

Sit on a chair with both feet flat on the floor. Raise your heels up off the floor then lower them back down slowly

How to contact us
